

**Abstract**

5 A method of configuring settings in an imaging  
device includes retrieving the previous state of a  
plurality of settings in the imaging device. The new  
state of the settings in the imaging device are  
determined. The new state is combined with the previous  
state to form an optimal state of the settings. The  
imaging device is then configured with the settings  
10 according to the optimal state.
